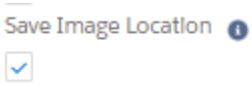
G-Link Store Location of Image Files in Salesforce Setup

Introduction

We have a feature that enables the automatic storage of image locations based on their metadata. Upon uploading a file, the system captures and stores the location information associated with the image. You just have to enable that feature by following the steps below.

Functionality Overview

1. Navigate to the **G-Link** app.
2. Click on **G-Link Administration**.
3. Click on **File Upload Page Configuration**.
4. Find the **Other Setting** section.
5. Set **Save Image Location** as true.



6. Upload an image file that contains metadata indicating its location.
7. Once uploaded, open the image in the G-File object to view the stored location information. The location will be seen in the **Image Location** field. If the Image Location field is not visible then Edit the Page Layout and add the Image Location(NEILON2__Image_Location__c) field in Page Layout
